

General Neurology

What is a neurologist?

A neurologist is a medical doctor who specializes in treating diseases of the nervous system.

What is the nervous system?

The nervous system is made of two parts: the central and peripheral nervous system. It includes the brain and spinal cord. Your central nervous system collects information from your sensory nerves to process and respond to them. It regulates everything your body does. Your peripheral nervous system feeds information to your brain from most of your senses. It carries signals that allow you to move your muscles.

What does a neurologist do?

Neurologists manage and treat neurological conditions, or problems with the nervous system.
